

Use case	Admin Area Access	
Release (id)	UC-03, v1.0, 26 April 2026	
Context of Use	A user with administrative privileges (Railway Administrator) accesses a restricted area to view system insights and statistics.	
Scope	Allow authorised administrators to enter the admin dashboard and view operational data.	
Level	Primary task (sub-function of Authentication)	
Primary actor	Railway Administrator	
StakeHolder & interest	StakeHolder	Interest
	Railway administrator	Needs secure, role-based access to statistics and revenue data
	IT operations	Wants access control to be traceable and auditable
Preconditions	→ The user is already authenticated via UC-02 (Authentication) → The user's role is "administrator" (special credentials, NFR 17) → The system is connected to the Database containing statistics (FR 32)	
Minimal Guarantees	→ Unauthorised access attempts are logged and rejected → No administrative data is leaked to non-admin users	
Success Guarantees	→ The administrator sees the admin dashboard with charts and tables (FR 31, FR 32) → Statistics are up-to-date and correctly reflect the underlying data	
Trigger	After successful login (UC-02), an administrator clicks "Admin Area" or navigates to /admin	
Description (Main Success Scenario)	Step	Action
	1	System verifies that the authenticated user has the "administrator" role (NFR 17).
	2	System grants access to the admin area (FR 31).
	3	System loads statistics and insights from the Database (FR 32 – sales, revenue, bookings).
	4	System displays the data as interactive charts and tables (OB 9).
	5	Administrator may apply filters (by date, train line, etc.) to refine the view.
Extension	Step	Other action
	1a	If the authenticated user does not have the admin role, system denies access and shows "Access forbidden".
	2a	<i>If the admin area is accessed without prior authentication, system redirects to the login page (UC-02).</i>
	3a	If the Database is slow or unavailable, system shows a cached version (if any) and a warning message.
Technology & data Variations	→ Admin credentials require additional verification (e.g., second factor or manual approval) beyond regular registration (NFR 17). → Statistics are visualised using a JavaScript charting library; data is fetched via secure API calls. → Access to the admin area is logged with timestamp and user ID for auditing.
